

Service Bulletin: Matereality Workgroup Material DatabasePro v15 Software for Materials Data Management Powered by Altair Units

October 2023

An updated app from Applus Software is now available through the Altair Partner Alliance for improved access to Matereality Workgroup Material DatabasePro software for materials data management.

Benefits of the new version

- Corrects issues encountered in the original APA-enabled app with connectivity to your Altair license server for proper token usage
- Embeds a web browser inside the app so you can interact seamlessly with the Matereality software
- Provides web-based software tools for materials data management across a Workgroup of up to 20 members, whether members are collocated or geographically dispersed

Downloading and using the new version

Click [here](#) to download the installer for the APA-enabled Matereality Workgroup Material DatabasePro v15 app from Altair's website.

Using the updated APA-enabled Matereality app still requires 35 tokens. You must be connected to your Altair license server, and you must log in to Matereality through the APA-enabled app to access your Workgroup successfully.

If you are currently using the original APA-enabled Matereality app, your existing login credentials will allow you to access your Workgroup through the updated app immediately after you download it.

If you are currently using the original APA-enabled Matereality app successfully, no action is required, but you may choose to switch to the updated app.

About Applus Software and Matereality

Materials information is an aspect of product data that must be accessible by engineering teams at many phases of the product life cycle. Matereality software was introduced in 2002 to meet the challenge of managing vast amounts of this complex and highly varied data in a digital environment. When deployed across the enterprise, Matereality software for materials data management brings harmony, efficiency, and control while minimizing risk.

Digitalization requires a strong understanding of both the virtual and real systems. Matereality software leverages more than 25 years of Applus DatapointLabs' experience in the operation of testing laboratories, and in understanding the physics of materials, as used in simulation and in product development. Applus Software now provides robust, field-tested, patent-protected, cloud and enterprise Matereality software solutions to companies seeking to gain control of their materials information.
